TELMETRIC smart electronic heat cost allocator

Dear Tenant,

In future, the electronic heat cost allocator TELMETRIC smart will record your heat consumption. The installation of metering devices is a legal requirement to enable consumption-based billing to be carried out. This creates opportunities for energy efficiency and helps to identify potential savings.

At the end of the billing period, the consumption value on the cut-off date (31st December) is stored in the device and then read out remotely by radio. This means that you no longer need to be present for the meter reading.

The last cut-off date value remains stored in the device and can be accessed by you for one whole year.

Reliably informed

TELMETRIC smart electronic

heat cost allocator

The TELMETRIC smart electronic heat cost allocator determines consumption directly at the radiator. To record consumption, two temperature sensors are used to determine the room and radiator temperatures and, from this, the amount of heat emitted by the radiator.

The device features an LC display which shows the consumption values and other essential data. TELMETRIC smart transmits the consumption values and meter data by radio. The device is approved in accordance with Section 5 of the Heating Costs Ordinance.

Advantages at a glance:

- Interference resistance through self-monitoring and cut-off date values
- No need to enter the rental properties to take readings
- CE-compliant
- Tamper-proof (seal)

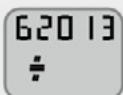

Important technical data:

Transmission power <10 mW
Radio frequency 868 MHz
Operating life 12 years
Area of application DIN EN 834

Displays on the LC display:

The display is active from 5 a.m. to 9 p.m. At other times, the display can be activated by touching the lower right-hand corner.

The display shows the following values for 8 seconds each:

Device number

- uniquely identifies the device

Current consumption

- shows the current consumption / meter reading
- is also used for interim readings

Cut-off date value

- consumption value at the end of the last billing period
- in the first year, this amounts to 0.

Valuation

- also valuation factor or conversion factor
- serves to ensure uniform scaling

Important for you to know: The TELMETRIC smart electronic heat cost allocators continue to count beyond the billing period (31st December of the year). The current consumption values are added to the values from the previous billing period. The value is not reset to '0'.

In order to read the consumption for the current billing period, you must therefore deduct the final reading for the last billing period. Both values are shown on the device display.

In the event of a serious error, attempted tampering or destruction of the device, TELMETRIC smart will cease taking measurements. An 'F' appears on the display in addition to the other indicators. **If a device is defective, please notify the Gewobag Service Centre immediately.**
